

***Kuraray cements are high-performance dental adhesives that provide flexibility in their application. Cements range from dual-cure composite systems to self-etching, self-adhesive, dual-cure fluoride-releasing resins.***

**Why CLEARFIL and PANA VIA Cements?**

- Superior strength and longevity
- Easy to match shades and color stability
- Advanced delivery methods and ease of use
- Little or no post-operative sensitivity

**Resin Cements**

**CLEARFIL Esthetic Cement EX**~virtually no operative sensitivity, dentin sealing with self-etch bond, easy to use with automix dispensing directly into restorations, high bond strength, try-in paste accurately matches the cement color and thickness, minimum shade selection for very wide applications, superior physical properties, strong wear resistance

**PANA VIA 21**~MDP adhesive monomer (high bond strength to enamel, dentin, metal, alloys, ceramics, composite resin restorations), reliable cement system with self-etch “ED Primer” for tooth structure, user-friendly dispenser, available in EX (white), TC (tooth color) and OP (opaque), radiopaque and insoluble

**PANA VIA F 2.0**~MDP adhesive monomer, self or light cure, one-step self-etch primer “ED Primer 2” significantly reduces sensitivity, convenient working and setting times with high bond strength, fluoride releasing, radiopaque and insoluble, complete kit includes everything for cement

**CLEARFIL SA Cement**~exceptional handling, very low technique sensitivity with consistent bond strength even to over-dry and wet dentin/enamel, high bond strength for any restorations, excellent marginal sealing/protection from marginal leakage, low solubility/low film thickness for optimal cementation, simple to use, fluoride releasing
